

Case Studies in Advanced Thermostat Control for Demand Response

Joseph S. Lopes
Applied Energy Group, Inc.
With updates (2008)

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

1

Introduction

- **More Demand for Demand Response Programs!**
 - Utilities no longer control supply in many states due to deregulation
 - Need for more flexibility and “distributed” options like demand-side peak reduction
 - Regulators, consumers concerned about shortages and price spikes
 - Transmission constraints

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

2

Introduction

- **What are the best options for proven demand response?**
 - In Summer-peaking systems, air conditioning loads are the primary driver of peaks
 - Air conditioning is somewhat discretionary
 - New homes have a high degree of air conditioning
 - Nearly all businesses have air conditioning

Air Conditioning Demand Response

- **Historically, implemented with one-way switches on central A/C systems**
- **New generation of electronic thermostats now available and used by many utilities:**
 - Two-way communications, which ensures verification of signal reception
 - Monitoring and control capability
 - Internet access
 - Interval data (runtime and temperature) available for virtually all sites
 - Customer overrides can be tracked/time-stamped

Case Studies

- **AEG experience with six utilities:**
 - LIPA (NY), Southern California Edison, Consolidated Edison, Aquila, **Colorado Springs Utilities, FPL Energy**
 - Use the same technology electronic programmable thermostats with override
 - Thermostat with two-way communications and data access via public pager networks
 - Control of either duty cycle or temperature
 - Internet access
 - Hourly runtime and temperature data available for virtually all sites
 - **Actual programming (7-day, 4-period setpoints), mode (auto, cool, heat) and status (hold on/off: programming used/not) available**

J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

5

Controllable Thermostat

Programmable thermostat with 2-way pager access

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

6

Case Studies

- **Long Island Power Authority (LIPA)**
 - Since 2001, Central A/C units in over 20,000 residential, 3,000 small commercial
 - Free thermostat and \$25 (one-time)
 - Customers have thermostat access over Internet
 - LIPA can control up to 7 days from 2-6 pm
 - Customer can override without penalty

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

7

Case Studies

- **Consolidated Edison Company of NY**
 - Since 2002, now over 15,000 thermostats at residential sites
 - Free thermostat and \$25 (one-time)
 - Thermostat access over Internet
 - Controls when NY ISO requests (typically peak summer days 1-6 pm)
 - Customer can override without penalty
 - **Small Commercial Pilot Program (2004)**
 - Same terms except scalable one-time incentive (\$25 per 3 ton increment)
 - By 2008, over 6,000 thermostats

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

8

Case Studies

- **Southern California Edison (SCE)**
 - Since 2002; target of 5,000 small commercial sites (achieved in 2003); approved for 2004
 - Free thermostat plus \$300 annual incentive, with \$5 penalty for each override
 - Control varies from 1-6 pm; in 2003 up to 20 control days allowed
 - Logger data on sample confirmed runtime data accuracy (within 3%)

Thermostat Control Options

- **Duty Cycle Control**
 - Limits runtime to a fixed percentage (e.g. 50% control limits to 15 minutes off per half-hour)
 - LIPA and Con Edison typically used 50% duty cycle control
- **Setpoint Temperature Control**
 - Increase current A/C thermostat setpoint by a specific value (e.g. 4 degrees)
 - SCE typically used 4 degree temperature control

DLC Impact Evaluation

- **Hybrid Comparison Day Analysis**
 - Use best comparison day, based on closest day with similar weather
 - Temperature, humidity, heat build-up
 - Patterns change over course of summer
 - Not cost-effective to collect every day
 - Compare baseline and control day
 - 2-3 hours before control hour should match closely
 - Small Adjustment may be needed to match up

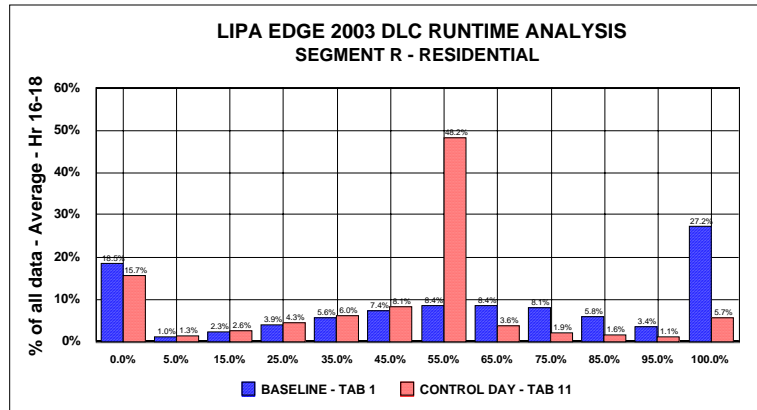

Duty Cycle Control Case

- **LIPA (NY) and Con Edison**
 - Use 50% Duty Cycle Control
 - Both residential and commercial sites
 - Typically control during afternoon utility peak period (1-6 pm or 2-6 pm)
 - Allow overrides without penalty
 - Can confirm control and monitor overrides

Duty Cycle Control Case

15-18% off; 25% of baseline @ 100%; only overrides over 55%

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Duty Cycle Control Case

Control 3-6 pm; Some "payback" after control ends

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Duty Cycle Control Case

Impacts reduced over time mainly from increased overrides

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Duty Cycle Control Case

Residential: 15% off; 44% of baseline @100%

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Duty Cycle Control Case

Residential 1-6 pm control - some "payback" after control ends

Case Studies in Advanced Thermostat Control for Demand Response
 J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

17

Duty Cycle Control Case

Impacts reduced over time mainly from increased overrides

Case Studies in Advanced Thermostat Control for Demand Response
 J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

18

Duty Cycle Control Case

Commercial: About 40% @100%, nearly 30% of units were off

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Duty Cycle Control Case

Control 3-6pm; No observed payback

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Duty Cycle Control Case

Impacts reduced over time mainly from declining loads

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

21

Duty Cycle Control

- Only effective on customers whose base duty cycle (runtime) exceeds limit (e.g. 50%)
- Impacts are larger on more severe days as more customers exceed the duty cycle limit – more suited to emergency operation
- Impacts are more consistent and maintained for a longer period
- Potentially more severe on some customers than others, such as those with undersized systems
- Easy to identify overrides from runtime data

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

22

Setpoint Temperature Control Cases

- **Southern California Edison (2003)**
 - Thermostat setpoint increased
 - #1: Aug 12 (3-5, 2 deg.) – 96 degrees max
 - #2: Aug 15 (2-6, 4 deg.) – 98 degrees max
 - #3: Aug 18 (2-4, 4 deg.) – 88 degrees max
 - About 4,400 runtime data points each day (all commercial sites)

Setpoint Temperature Control Cases

98° max day; 4° setpoint change 2-6pm, no payback

Setpoint Temperature Control Cases

RED (96° max) 3-5pm, 2° control; BLUE (98°) 2-6pm, 4° control;
GREEN (88° max) 2-4pm, 4° control

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Setpoint Temperature Control Cases

98° Day (2-6pm, 4° control) hourly indoor temperature impacts

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

Setpoint Temperature Control Cases

RED (96° max) 3-5pm, 2° control; BLUE (98°) 2-6pm, 4° control – Indoor Temperature Impacts

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

27

Setpoint Temperature Control

- Affects all customers equally in terms of relative comfort
- Impacts are consistent across a range of weather conditions – more suited to frequent use as a load reduction option
- Impacts are more pronounced in first hour and decline in subsequent hours
- Potential for customers to pre-cool and reduce impact achieved
- Could penalize customers already conserving
- Difficult to identify overrides from runtime data, but should see fewer overrides

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

28

Duty Cycle vs. Setpoint Control

- **Duty Cycle Control**
 - More effective for longer periods
 - More suited to residential
- **Temperature Setpoint Control**
 - More consistent across participants
 - Higher initial hour impacts
 - More suited to commercial (declining PM loads)

Free Riders

- **Some Participants off during control period:**
 - App. 15-18% of residential units off on hot days
 - Mostly people not home, on vacation or prefer not using their A/C
 - Some multiple units (e.g. 2nd Floors) are 31% of LIPA; 81% of all units are single/1st
 - App. 22-30% of comm. units off on hot days
 - Multiple units are 60% of all units in SCE; 60% of units are single/1st; 21% are 2nd units

Free Riders: Multiple Units

Commercial: 2nd Units use only 79% of Primary Units;
3rd Units only 65%, 4th units 55%, etc.

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

31

Free Riders

- **Could only be reduced by pre-qualifying units at a site to increase average impacts**
 - Potential Discrimination Issue
 - Minimum summer use billing increment level
 - Residential sites could exclude 2nd floor if only bedrooms (lower use and less coincident)
 - Commercial sites would require evaluation of likelihood of little-used units
- **Free Riders are generally unavoidable, but must be factored into any assessment of potential impacts and costs**

Case Studies in Advanced Thermostat Control for Demand Response
J. Lopes; AEIC Load Research Conference – St. Louis, MO; July 2004/Updated 2008

32

SUMMARY

- **For Residential programs**
 - Duty cycle control works best, especially for only a few control days per season
 - Could reduce free riders by target marketing to higher summer use customers
 - Temperature setpoint control would work best for energy conservation improvements (by utility or customer)
 - Most customers (77%) use programmable features of thermostats themselves

SUMMARY

- **For Commercial programs**
 - Temperature setpoint control works best if many control days or short-duration curtailments – should also reduce overrides
 - Duty Cycle control works best for more hours of sustained load reduction
 - Runtime data could provide good source of baseline A/C load profiles by business type
 - Targeting specific business types would be advisable
